

Emsisoft Business Security

High-performance antivirus and anti-malware for endpoints.

Layered Protection

Central Management

Optional: AD Support

FINDING AND REMOVING MALWARE

Dual-engine virus and malware detection	Emsisoft (A) and Bitdefender (B) engines work together to detect all types of malicious software, including viruses, ransomware, trojans, bots, keyloggers, spyware and more. Signatures for double-detections are avoided for memory use and speed optimization.
Super fast system scans (1-2 min)	Scan your device quickly and thoroughly using our efficient dual-engine scanner. Scan time varies depending on which scan type you select.
PUP/unwanted programs detection	Alerts you of potentially unwanted programs (adware, browser toolbars, system optimizers, etc.) that can affect your device's performance.
Advanced infection cleaning	Smart operation processes ensure the safety and stability of the computer during system cleaning. Checks 70+ autorun/loading points including hidden ones used by rootkits and restores default values if they have been overwritten by malware.
Safe quarantine of suspicious files	Detected malware is stored in an encrypted format in quarantine so it can't cause any damage. You can submit a quarantined file to the Emsisoft Lab for detailed analysis.
Scan exclusions/allow list	Exclude known good files and folders from scanner detection. Supports wildcards (?, *) and 44 environment variables as generic shortcuts for common folders (%temp%, %windir%, etc.).
Scheduled scans	Scan the whole system at scheduled times. Includes highly configurable scheduling, logging and scan options.
Windows Explorer integration	Right click any file or folder in Windows Explorer to quickly initiate a scan.
Command line interface included	A powerful command line interface that features all the functions of the GUI software. Use it to automate common scanning tasks .
Emergency Kit maker included	Compile your own fully portable scan tool to clean third-party devices of malware infections. Save the Emergency Kit to a portable device like a thumb drive.

PREVENTING NEW INFECTIONS

Multi-layered real-time protection	We use diverse technologies and multiple layers of security to maximize our solutions' protection capabilities.
Web Protection	Blocks access to known dangerous websites using a frequently updated block list. Web Protection is host-based and works across all programs, even if the transferred web data is encrypted.
Anti-phishing	Blocks access to known fraudulent websites that try to steal online banking passwords or identity details.
Browser security	Browser extension/addon for Chrome, Firefox and Edge that blocks access to dangerous websites on a URL level. Uses a privacy-conscious design that doesn't track your browsing history or break your SSL encryption chain.
File Guard	Scans all downloaded and executed files with the dual-engine scanner.
Behavior Blocker	Detects zero-day malware by monitoring the behavior of all running programs. The Behavior Blocker is the main line of defense against specialized attacks.
Anti-Ransomware	Reliably stops ransomware before it encrypts files.
Exploit prevention	Generically prevents exploits from injecting code into foreign programs to execute harmful payload.
System manipulation prevention	Detects exe-patchers, hidden rootkits, autoruns, host changers, browser settings changers, group policy changers and invisible installers.
Application hardening	Controls potentially dangerous procedures within active programs. E.g. prevents commonly attacked software like MS Office from being able to execute dangerous PowerShell scripts, and more.
Advanced Persistent Threat (APT) protection	APTs are attacks where an intruder establishes a long-term presence in your network to exfiltrate data. The Emsisoft Behavior Blocker, the Application Hardening and advanced heuristics detect such intrusions before damage is done.
Fileless malware protection	Behavior Blocker, Application Hardening, Registry scanning and script monitoring prevent fileless malware infections, which reside only in memory.
Targeted attack prevention	Stops customized attacks, including spear-phishing, single-use malware, state trojans and industrial espionage.
Botnet protection	Behavior Blocker and signature-based scanner heuristics protect your devices from becoming part of a botnet that criminals use to perform malicious or fraudulent actions.
False positives verification	Detected objects can be verified with our reputation online service to ensure that legitimate programs are not unnecessarily alerted or quarantined.

PREVENTING NEW INFECTIONS

Protection exclusions/allow list	Exclude known good files and folders from real-time protection. Supports wildcards (?, *) and 44 environment variables as generic shortcuts for common folders (%temp%, %windir%, etc.).
Hourly automatic updates	The protection software always keeps itself up-to-date, including detection patterns and functional improvements.
Emergency network lockdown mode	Click the on/off switch to instantly take your devices offline. Can also be controlled remotely via the Management Console.
Shutdown & uninstall prevention via password	Set a local security admin password to ensure that attackers won't be able to disable or uninstall protection even if they gain full access to the device.
Windows Firewall monitoring and hardening	Checks if the Windows Firewall is enabled and protects it from being manipulated by third-party software.
Windows RDP attack detection	Checks if the Windows Remote Desktop service (RDP) is enabled and alerts you when it is under brute force attacks.

ENDPOINT DETECTION AND RESPONSE (EDR)

Suspicious behavior tracking	Suspicious process activity is analyzed in the cloud and accessible through the Incidents panel.
Local detections on devices	Analyze all threats detected by the local disk scanner and real-time protection.
Quick allow/quarantine/block everywhere	Allow, quarantine or block a specific file in your entire workspace with a single click.
Device isolation	Take selected devices offline with a single click while keeping them connected with the console for further threat analysis.
Execution tree & timeline	Trace potential threats back to their origin to see how they entered your workspace.
MITRE ATT&CK tactics & techniques	Standardized classification of malware behavior patterns.

CENTRALIZED MANAGEMENT

Management Console included (Simplified)	Centralized security management has never been easier. See the protection status of all your devices on a single dashboard at MyEmsisoft.
Industry leading mirror view	Using the Management Console feels like you're in front of the protected device. All settings and features can be controlled, changed and applied in real-time.
Web access & mobile app	The Management Console can be accessed via web browser or used as a mobile app, so you can take care of your security needs from any device.
"Local only" management mode	Disables all cloud based management features but still enables automatic updates, licensing and online lookups of malware findings. Provides maximum privacy.
"Local & remote" management mode	Allows protection settings to be configured locally on the protected device and remotely via the Management Console. Provides maximum flexibility for users and admins.
"Remote only" management mode	Disables access to settings and simplifies the user interface on the protected device. Recommended for larger organizations. Provides maximum control for admins.
Traffic caching relay devices (multiple)	Configure one or more of your devices to act as a relay for all Internet data transfers. Relays cache software updates to reduce the total amount of internet traffic. Only data from and to Emsisoft servers is allowed through.
Incident investigation tools	See all alerts of all your devices on a single dashboard. Drill down to device level to check detection logs and details.
Forensics & audit logs	See exactly what happened in your workspace and who performed certain actions or configuration changes.
Remote scans & quarantine	Initiate a malware scan remotely at any time and watch the scan status live. All scan types are supported. Check quarantined objects on any device for further analysis.
Device isolation	Take devices offline within seconds if you suspect a malware infection. Remote management for incident investigation is still possible but all other network communication is blocked.
Device health & system overview	The device dashboard shows security-related information on device health, including current protection status, firewall and RDP service. Also shows real-time system parameters like storage, memory, IP addresses, critical system events and device hardware properties.
Email, webhook & push notifications	Receive real-time notifications for specified events such as malware findings or device issues. You can process notifications by email or webhooks, or have them pop up on your device as a push notification for urgent situations.
Advanced reporting	View real-time data analysis and scheduled snapshots. Reports can be template-based and fully customized.
